Coopequate

Coopequate is a tool used for teaching STEM subjects such as math and coding, and is implemented in Java. The student displays the Quateboard, a specialized whiteboard, and the tutor uses remote screen sharing software to interact with the student's screen. For some subjects, the student displays the Quatescreen, which is not limited to monospaced text. A chat window (always on top) takes care of the student's questions and the teacher's instructions. Tutors and students pay $20 and $10/year respectively to access customized versions of the Quateboard/Quatescreen. The basic math Quateboard is free for all users.

Quateboard

The Quateboard supports math being taught, using text in monospaced mode. Most of its functionality is written in Java, but extensions used to teach STEM subjects are written in Cooperscript. The most commonly used commands are as follows:

- Use the arrow keys to move the cursor.
- Type underscore(s) to underline the numerator of a fraction.
- Use the special character command (Ctrl+K) to insert special characters such as pi, square root, sum, and integral.
- Use Tab/Shift+Tab to display/undo the next step in the math problem being solved.
- Type question mark (?) to explain the current step or to break the current step down into lower-level steps.
- Click on Help after typing question mark to access the help system.

Miscellaneous commands:

- Use asterisk and slash for multiply and divide.
- Fractions or matrices enclosed in brackets use tall brackets.
- Smart down/up arrow: press it after inserting a character moves the cursor beneath/above that character.
- Functions such as lines and parabolas can be plotted interactively on a graph.
- The default-to-upper-case setting assumes that all letters entered are upper case (use the shift key to enter a lower case letter), so Caps Lock is unnecessary.

Quatescreen:

- Display screen based on Coopertags, a text markup language
- May include panels, some containing a Quateboard

Expression Language

Mathematical expressions are encoded (internally) using the Cooperscript programming language. Each step in the math problem being solved manipulates this Cooperscript expression. Even if the user enters steps in a different order than the default ordering, the simplification logic can handle that. The user can type Tab/Shift+Tab to redo/undo her previous step, as well as to redo/undo the computer's previous step.

Advanced Quateboard Commands

These next 2 paragraphs may be ignored, they are written in computerese. Use Shift+Arrow Key to highlight a rectangular block. Press Insert to insert a row or column of spaces before a highlighted block (insert blank line if no highlight). Press Shift+Insert/Delete to insert/delete an entire row/column when a block is highlighted. Press Enter at end of a line of text: insert blank line, back up on that line to line up with beginning of text on previous line. Press Enter on blank line to back up to line up with beginning of text on a previous line, or insert blank line if already at beginning of line. Press Ctrl+Tab to move forward to line up with beginning of first or next word on a previous line. Press Home to move to beginning of text on current line, press it again to toggle between beginning of line and beginning of text. This usage of Enter, Tab and Home is useful for editing program code with multiple indentation levels. The user doesn't have to memorize these commands: type question mark at any time to access the help system.

Superscripts

Superscripts and subscripts in monospaced mode are handled by employing a vertical offset of half a line per level of superscripting or subscripting. The caret symbol (^) is used as a superscript prefix, double-caret (^^) is used as a subscript prefix, and backslash (\) is used as an escape character (terminate super/subscript with a semicolon). Carets and double-carets cannot be mixed (exception: one level of superscript can be combined with one level of subscript).

Implementation Steps

1. Develop foundation of Cooperscript code execution - ***almost done!***
2. Develop rest of Cooperscript code execution
3. Release Cooperscript as console-based compiler on GitHub
4. Implement GUI: monospaced mode
5. Release Cooperscript/GUI on GitHub
6. Write Coopertags design specs
7. Develop Coopertags
8. Integrate Cooperscript with Coopertags
9. Cooperscript/Coopertags: Cooperscript RUN-time Environment (CRUNE)
10. CRUNE is open source
11. Develop Cooperscript code editor
12. Expand code editor to Cooperscript SDK
13. Implement Quateboard using Java
14. Implement algebraic expression handler of Quateboard using Cooperscript
15. Develop monetizing functionality
16. Perform beta testing using Progress Place and West Neighbourhood House
17. Launch website
18. Purchase Google AdWords advertising
19. Implement Keyboard Aid (bells and whistles of editor)
20. Develop WYSIWYG Coopertags screen editor

About Us

I am Mike Hahn, the founder of Coopequate.com. I was previously employed at Brooklyn Computer Systems as a Delphi Programmer and a Technical Writer (I worked there between 1996 and 2013). At the end of 2014 I quit my job as a volunteer tutor at Fred Victor on Tuesday afternoons, where for 5 years I taught math, computers, and literacy, and became a volunteer math/computer tutor at West Neighbourhood House. I quit that job in mid-2019. I have a part-time job working for a perfume store. My hobbies are reading and I often go for walks. I don't read books very often, but on March 19, 2021 I started reading a biography of Steve Jobs which my brother gave me. I read the CBC news website, news/tech articles on my Flipboard app, and miscellaneous articles on my phone (same screen as my Google web page). I visit my brother once a month or more. For almost 30 years I was depressed on and off (I'm a rapid cycler), but it largely vanished after I ramped up development of my previous Aljegrid project in early March 2021.

Cooperscript

Cooperscript (implemented in Java) is an open source Python dialect in which all operators precede their operands, and parentheses are used for all grouping (except string literals, which are delimited with double quotes, also statements are separated by semicolons). Cooperscript source files have a .COOP extension. Coopertags files (the sister language of Cooperscript, a text markup language) have a .CPTG extension. Cooperscript boasts an ultra-simple Lisp-like syntax unlike all other languages. COOPERScript: Compact Object Oriented Programming Environment and Runtime System.

Special Characters

Core:

- ( ) grouping
- - word separator
- ; end of stmt.
- : dot operator
- " string delimiter
- \ escape char.

Operators:

- + - * / %
- = < >
- & | ^ ~ ! ?

Other:

- # comment
- {} block comment
- _ used in identifiers
- $ string prefix char.

Differences from Python

- Parentheses, not whitespace
- Operators come before their operands
- Integration with Coopertags
- Information hiding (public/private)
- Single, not multiple inheritance
- Adds interfaces ("hedron" defs.)
- Drops iterators and generators
- Adds lambdas
- Adds quote and list-compile functions, treating code as data
- Adds cons, car and cdr functionality

Keyboard Aid

This optional feature enables hyphens, open parentheses, and close parentheses to be entered by typing semicolons, commas, and periods, respectively. When enabled, keyboard aid can be temporarily suppressed by using the Ctrl key in conjunction with typing semicolons, commas, and periods (no character substitution takes place). By convention, hyphens are used to separate words in multi-word identifiers, but semicolons are easier to type than hyphens. Similarly, commas and periods are easier to type than parentheses. Typing semicolon converts previous hyphen to a semicolon, and previous semicolon to a hyphen (use the Ctrl key to override this behaviour). Typing semicolon after close parenthesis simply inserts semicolon. Typing space after hyphen at end of identifier converts hyphen to underscore. The close delim switch automatically inserts a closing parenthesis/brace/double quote when the open delimiter is inserted.

Coopertags

Coopertags is a simplified markup language used to replace HTML. Mock JSON files using Coopertags syntax have a .CPJS extension, and include no commas. Instead of myid: val, use [myid: val]. Instead of [1, 2, 3], use [arr: [: 1][: 2][: 3]]. Arbitrary Coopertags code can be embedded in the Cooperscript echo statement. Coopertags syntax, where asterisk (*) means occurs zero or more times, is defined as follows:

Tags:

- [tag]
- [tag (fld val)*: body]
- [tag (fld val)*| body |tag]

Body:

- text
- [(fld val)*: text]*

Cooperscript call:

- [expr: <expr>]
- [exec: <stmt>...]
- [coop: <path>]

Cooperscript Grammar

White space occurs between tokens (parentheses and semicolons need no adjacent white space).

Grammar Notation

- Non-terminal symbol: <symbol>
- Optional text in brackets: [*text*]
- Repeats zero or more times: [*text*]…
- Repeats one or more times: <symbol>…
- Pipe separates alternatives: *opt1* | *opt2*
- Comments in *italics*
